WHAT IS NANO?

Nanotechnology, nano for short, is the manipulation of matter on an atomic, molecular, and supramolecular scale. It is one of the most exciting and most researched scientific areas in the modern times. In medicine, we are discovering research on new ways to deliver drugs with hard-to-absorb properties such as Curcumin from Turmeric, Resveratrol, CoQ10, and all of the different Cannabinoids from the Hemp plant.

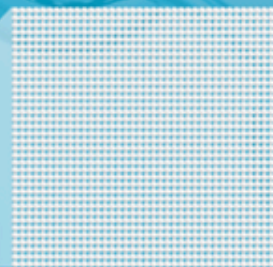

A nanometer is a one-billionth of a meter or one-millionth of a millimeter, the term is used to express the dimension at an atomic scale, a nanometer is approximately 100,000 times smaller than the width of a human hair.

On scale, a soccer ball is the same size in relation to Earth as a nanoparticle is to the soccer ball.

WHY IS NANO CBD BETTER?

Bioavailability is an important aspect to keep in mind when it comes to supplementation. The main advantage of nano CBD supplements is mainly in its higher percentage of absorption of the active substance. Since lysosomes can assimilate nutrients by alternative metabolic pathways, this causes better absorption. However, as these nanospheres protect the active substance of gastric juices from the stomach by preventing their degradation, they are also able to increase their absorption in the intestine. So, to put it in layman's terms, our nano CBD has up to 10x the absorption of our non-nano competitors. And with our unique NanoZorb® technology, our extraction process, and absorption characteristics, **our products are just more effective.**

SUPERIOR ABSORPTION RATES OF NANO

WHAT IS NANOZORB?

NanoZorb® is our proprietary & trademarked nano process that will give you & your customers a more effective & more absorbable product. We have built, from the ground up, a revolutionary three stage nano particle processor which ensures a lipid bond for cellular recognition, as well as a particle sizes of less than 100nm and as small as 5nm.

The NanoZorb® technology provides a superior method for enhanced solubilization of various compounds (a process which increases the dissolution rate of poorly soluble ingredients) and reduces micron-sized compounds to nanoparticles (miniaturization). The nano particles are then stabilized against

agglomeration by surface absorption of selected GRAS (Generally Recognized as Safe) stabilizers along with other trade secrets that have been developed.

The result of this revolutionary processing technique is a dispersible liquid nanosuspension of various substances which dramatically improves stability, along with dispersion and absorption. These then can be processed into finished dosage forms for various routes of administration. After many years of testing, we believe this is one of the most stable nano processes in the world. We also have scientific proof of our nano particle size.
